1. レーウィンゾンデとオメガゾンデ

1. レーウィンゾンデとオメガゾンデ

2つのゾンデの高さは気圧と温度によって算出されるが、2つのゾンデから得られる独立の高度を縦軸として風速,風向,風速の偏差,風向の偏差,温度,温度の偏差,湿度,湿度の偏差などを横軸に取ったデータを90~155ページに示す。ここで言う偏差とは、オメガゾンデによる測定値からレーウィンゾンデを引いたものである。風の図では左から順に風速,風向,風速の偏差,風向の偏差となっている。偏差は高度の分解能の低い方を基準にとり、レーウィンゾンデのデータに対応するオメガのデータを内挿して算出する。レーウィンのデータは高層観測MTデータの内風観測記録を使い,温度と湿度はゾンデ観測記録を使った。温度,湿度の図では左から順に温度,温度の偏差,湿度の偏差となっている。オメガは2秒毎に出力されるデータを使った。

縦軸を放球後の時間に取ったデータが時間軸156~200ページである。高度軸のデータ種目の他に気圧と高度がある。図では気圧、気圧の偏差、高度、高度の偏差という順になる。このデータは気圧と温度で高度を求める事をする必要がないので、2種のゾンデがほとんど同じ場所にあると考えられる連結観測の場合に、気圧や高度等の比較をする事ができる。したがって、時間軸表示では連結観測のデータしか表示していない。

偏差の表示はレーウィンゾンデのデータのあるところをサンプリングしているので、一定間隔では必ずしもない。
