I-1. Final report of the first meeting of WMO Task Team (Geneva, Switzerland, 30 November - 2 December 2011)

I-2. Final report of the second meeting of WMO Task Team (London, UK, 1 - 3 May 2012)

I-3. Final report of the third meeting of WMO Task Team (Vienna, Austria, 3 - 5 December 2012)

WORLD METEOROLOGICAL ORGANIZATION

COMMISSION FOR BASIC SYSTEMS

MEETING OF THE WMO TASK TEAM ON METEOROLOGICAL ANALYSES FOR FUKUSHIMA DAIICHI NUCLEAR POWER PLANT ACCIDENT

GENEVA, SWITZERLAND, 30 NOVEMBER – 2 DECEMBER 2011

FINAL REPORT

Kazuo Saito, Alice Soares, Roland Draxler, Matthew Hort, Geoff Love, Peter Chen, Gerhard Wotawa

EXECUTIVE SUMMARY

The first meeting of WMO Technical Task Team (TT) on Meteorological Analyses for Fukushima Daiichi NPP accident took place at the WMO Headquarters, in Geneva, Switzerland, from 30 November to 2 December 2011. The TT's work is to examine how the use of meteorological analyses, and the introduction of additional meteorological observational data, could improve the atmospheric transport, dispersion and deposition calculations as validated against radiological monitoring data, which at a minimum should contribute to the requirements which the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) stated in its request for assistance from WMO. At the same time, this work should contribute to the review and possible enhancements to the nuclear emergency response system, presently in place.

The TT reviewed and adopted its Terms of Reference, and reported on each of its terms, including: (a) meteorological observational data, (b) meteorological NWP analyses data, (c) gaps in the meteorological analyses, (d) meteorological conditions during the nuclear accident, (e) evaluation of the observational data and analyses, (f) uncertainty of the atmospheric dispersion and deposition calculations, (g) liaison with UNSCEAR, (h) proposal for enhancements of the WMO EER system. Mr Roland Draxler (RSMC Washington, USA) is named as the Chairperson of the TT.

The TT agreed to focus its work on the period 11 March to 20 April 2011. It developed a bibliography of relevant publications and presentations, stated its current point of view regarding arrangements for sharing of information, and agreed a tentative work plan to the planned completion of the final UNSCEAR study in 2013.

GENERAL SUMMARY OF THE WORK OF THE SESSION

1. Opening

1.1 The first meeting of the Technical Task Team (TT) on Meteorological Analyses for Fukushima Daiichi NPP Accident was opened by Dr Geoffrey Love, Director of the WMO Weather and Disaster Risk Reduction Services Department, on behalf of the Secretary-General of WMO. He expressed appreciation to the experts and their respective organizations for agreeing to contribute to this important work. He noted that while the WMO Environmental Emergency Response (EER) system responded well to the NPP accident during the response phase with real-time meteorological systems, including meteorological analyses and forecasts, and atmospheric dispersion predictions, the current task is to examine how the use of meteorological analyses and the introduction of additional meteorological observational data could improve the atmospheric dispersion calculations as validated against radiological monitoring data. The work of the TT should at a minimum contribute to the requirements which the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) has stated in its request for assistance from WMO. At the same time, this work should contribute to the review and possible enhancements to the EER system, which was essentially designed following the Chernobyl nuclear accident of 25 years ago.

2. Adopting of agenda and working arrangements

2.1 Mr Peter Chen of the Secretariat, introduced the Expanded Provisional Agenda, and suggested to the meeting to consider who could act as Chairperson for the Task Team. Mr Roland Draxler (USA), with the unanimous agreement of the participants, agreed to chair the TT and this first meeting.

2.2 The meeting revised and adopted the agenda, which is found in Annex I.

2.3 The list of participants is found in Annex II. The meeting was informed that Mr René Servranckx (Canada), Chairperson of the CBS Coordination Group for Nuclear Emergency Response Activities, had notified the Secretariat that he was unable to attend this meeting.

3. Introduction

3.1 The Secretariat provided background information related to the work of the TT, in particular the request of UNSCEAR to participate in its study on the levels and effects of the radiation released from the nuclear accident at the Fukushima Daiichi NPP.

3.2 This report adopted the acronym "ATM" to refer to "atmospheric transport, dispersion and deposition modelling", including the numerical simulation systems, and their outputs.

4. Terms of Reference

4.1 The meeting reviewed and revised the TT's draft Terms of Reference, which is found in Annex III.

5. Relevant period of interest

5.1 Although most of the known atmospheric emissions occurred in the last half of March 2011, the meeting noted that it was difficult to predict the future evaluations that will be performed and that the meteorological data requirements should cover a period from the time of the earthquake - tsunami until the situation had stabilized, 11 March through 20 April, 2011.

5.2 Discharges into the ocean may have occurred over a different time period. Therefore meteorological data may be required by the ocean modeling groups (marine dispersion experts) for a longer period. Other UNSCEAR groups, such as those studying land contamination, may also

require data for longer periods. Clarification is needed from the relevant groups. At this point no request was made to the Japan Meteorological Agency (JMA) or other meteorological services, regarding data provision for a more extensive period.

6. Response to the Terms of Reference (ToR)

(a) Meteorological observational data

a.1 The meeting reviewed the meteorological observational data, including from surface, upper-air radiosonde, upper-air wind profiler data, collected by JMA as summarized by K. Saito in Annex IV and determined that all of the data are potentially useful in evaluating the meteorological analyses, and any subsequent dispersion and deposition calculations using the analysis data, and possibly for use by other groups involved in the UNSCEAR assessment. It was proposed that the observational data be supplied in their native JMA binary format along with a description of this format. The archive location is to be determined after consultation with UNSCEAR data working group.

a.2 The meeting agreed that perhaps the most critical element in the deposition calculations was getting the precipitation correct. In this aspect, JMA agreed to provide their Radar/Rain Gauge analyzed precipitation fields available every 30 minutes at 1-km resolution (latitude-longitude, LL, grid), in GRIB2, as summarized by K. Saito in Annex IV.

(b) Meteorological NWP Analyses Data

b.1 The meeting reviewed the meteorological NWP analysis data created by JMA as summarized by K. Saito in Annex V and determined that:

- The 4D-VAR mesoscale analysis, including surface, at 3-hour intervals and 5-km 50-hybrid level resolution (Lambert Conformal, LM, projection), would be the most suitable for local and regional scale atmospheric transport, dispersion and deposition modeling (ATM).
- In addition hourly analysis data from the JMA nowcasting model (3D-Var) (LM projection / 5-km resolution / hourly / GRIB2 / U V T, including AWS data) would also be useful for certain studies.

b.2 JMA has agreed to reprocess these data sets from their internal archive format to GRIB2. The data will remain in the native Lambert Conformal horizontal coordinates on the original model levels.

b.3 Initially these data would be provided to Task Team participants for evaluation purposes and subsequently to UNSCEAR after consultation with their data working group. The archive location is to be determined after consultation with UNSCEAR data working group.

b.4 Although other groups are also creating high resolution meteorological analyses, it is uncertain whether these analyses can approach the level of observational data assimilated by the JMA products. However, other mesoscale analyses could possibly be used in the assessment of uncertainty limits to the critical meteorological fields and their inclusion into any future data archive is encouraged.

b.5 With respect to the global analyses fields, i.e. JMA (Japan), Met Office (UK), NOAA (US), CMC (Canada), and ECMWF (to be provided by ZAMG, Austria) agreed to make their model fields available, initially from their respective centers, but potentially at a common repository after consultation with UNSCEAR. See Annex V.

(c) Gaps in the meteorological analyses

c.1 The meeting agreed that it was difficult to determine what is required to improve the analyses used for the dispersion calculations prior to actually having evaluated these data in any

detail. However, one obvious problem emerged in the discussion that the long-range results were very sensitive to precipitation fields and the dispersion model scavenging coefficients.

c.2 NOAA provides estimated precipitation fields derived from CMORPH, see: (<http://www.cpc.ncep.noaa.gov/products/janowiak/cmorph.shtml>), and ftp://ftp.cpc.ncep.noaa.gov/precip/global_CMORPH/30min_8km/

CMORPH is a technique for generating global precipitation analyses at very high spatial and temporal resolutions (8-km horizontal resolution at hourly intervals) using precipitation estimates that have been derived from low orbiter satellite microwave observations, but there are known retrieval issues over land, problems with frozen precipitation and limitations in orbital coverage. Mr Draxler agreed to investigate their availability and provide these data to the Task Team and UNSCEAR.

c.3 The CMORPH data as well as similar global datasets could potentially be used by ATMs to better represent the precipitation encountered by the plume for long range studies. However, the value of these data has not been tested for atmospheric deposition applications, considering their known limitations.

(d) Meteorological conditions during the nuclear accident

d.1 The meeting reviewed a summary of the meteorological conditions in East Japan for the March 11-26 (2011) period, provided by K. Saito (see Annex VI for an extended discussion). He noted that the primary contribution to the Japan land areas may have occurred within two periods: March 15-16 and March 20-23. The meeting discussed that a preliminary report to UNSCEAR (May 2012) could incorporate an expanded discussion of these events building upon the material already provided by JMA.

(e) Evaluation of the observational data and analyses

e.1 The meeting discussed how the suitability of the existing meteorological analyses for ATM calculations could be assessed. The meeting assumed that these calculations would primarily rely upon the meteorological analyses produced by major weather centres rather than the meteorological observations. The meeting decided that the best approach would be to compare radiological plume calculations based upon the different analyses with each other and meteorological and radiological observations. This can be achieved through comparison of predicted and measured patterns or correlations which do not rely upon exact knowledge of the radiological source term beyond what is already established.

e.2 The WMO Secretariat will arrange with CTBTO for radiological measurement data availability and sharing under the framework of cooperation with UNSCEAR. In this context, the task team members assume that radiological data obtained by UNSCEAR will be available to the team for the support task as well as any scientific papers that result from these evaluations.

e.3 The meeting agreed that the mesoscale analysis provided by JMA (see b.1) would be used to run their ATM calculations in addition to their existing simulations with global analyses (ECMWF, NCEP, CMC, Met Office UK). Because wet deposition was recognized as a major source of uncertainty, consideration will be given on how to best use the JMA high resolution precipitation analysis (1-km, 30-min).

e.4 The chairperson presented to the meeting a possible framework for conducting the ATM simulations independent of any emission assumptions. The computational scheme was based upon creating multiple ATM runs for specific time intervals using a unit emission rate that can later be multiplied with any time varying emission scenario without having to rerun the ATMs. The meeting agreed to use this framework as a reference and produce output fields in accordance with the scheme. Technical details are provided by the chairperson, included in Annex VII. Mr Draxler

also agreed to host a web page (see: http://ready-testbed.arl.noaa.gov/READY_fdnpp.php for a prototype) that will include the modeling results from the other participants.

e.5 The meeting discussed possible ways to evaluate the different ATM results against the measurements. It was agreed that the DATEM framework (<http://www.arl.noaa.gov/DATEM.php>) created by NOAA would be the most efficient approach to perform this comparison. ZAMG agreed to convert the radiological measurement data to the DATEM format, and NOAA agreed to investigate how these measurement data could be incorporated into the computational framework.

(f) *Uncertainty of the atmospheric dispersion and deposition calculations*

f.1 The meeting discussed the various uncertainties involved in the calculation of dispersion and deposition. Although suitable meteorological analysis data sets have been identified, there will always be some uncertainty regarding the meteorological parameters at any one point in space and time because the data analysis fields are snapshots in time which are averaged over grid cells with underlying complex terrain. Most of the time, the prevailing flow direction was offshore away from the existing land-based monitoring network. The remaining significant releases with on-shore flow were related to complex meteorological situations (see Section 6 (d)) with rapidly changing wind direction and variable precipitation patterns. Model derived wet deposition calculations carry large uncertainties and therefore observed precipitation fields need to be incorporated into the calculations.

f.2 The meeting proposed the use of the results from the framework discussed in the previous section to address uncertainties described above. The framework allows for the comparison of multiple model results either with different meteorological analyses using the same ATM model or, the same meteorological analysis using different ATMs. This would provide an estimate of the range of possible air concentration and deposition values,

(g) *Liaison with UNSCEAR*

g.1 The meeting noted that the proposed modeling framework did not require a precise knowledge of the emissions and in fact could be used by UNSCEAR to optimize the emissions to match the measurement data. However for certain model comparisons, it would be desirable to have an estimate of the temporal variation of the emissions. The Task Team would rely upon advice from UNSCEAR source term group to propose a scenario that can be used for meteorological model evaluations.

g.2 As was already discussed in the previous section, the most appropriate way to evaluate meteorological analyses in this case is to compare the ATM outputs based upon these analyses with radiological measurement data. In that aspect, the Task Team would rely upon the UNSCEAR data group to provide access to the appropriate measurement data.

g.3 The group agreed to provide UNSCEAR access to the model comparison framework and/or to the individual ATM calculations.

g.4 The working arrangements between UNSCEAR Expert Group B and the WMO Task Team will initially be coordinated through the chairpersons from each group. However, it is expected that the groups would meet as needed to discuss technical issues, either through Telecon or Webex meetings if possible.

(h) *Proposal for enhancements of the WMO EER system*

h.1 The meeting agreed that the results of the Task Team are important in the consideration of future EER products and services.

 - Kato, M. et al., Transport and diffusion simulation using CReSS.

8. Arrangements for sharing information

8.1 The meeting noted that the creation of a central data repository for all meteorological and ATM products considered by the Task Team is not currently feasible. The Task Team noted that UNSCEAR would address the data repository issue in their data sharing plan.

8.2 With respect to the data, it is expected that all data collected and generated in this effort will be shared between UNSCEAR and the Task Team.

8.3 The meeting noted that all results generated by the Task Team will become publicly available, either through the web or scientific publications.

9. Work plan and timetable

16 January 2012 - Task Team Meeting Report (Draxler and Secretariat)

30 January – 3 Feb 2012 – UNSCEAR work group meeting

Week of 6 February - TT teleconference (to revise work plan and timetable)

March 2012 – sample mesoscale analysis available from JMA (Saito)

April 2012 – TT to provide preliminary ATM results for the full period (11 March to 20 April 2011) to NOAA (Draxler) in the model evaluation framework format.

23 April 2012 – TT meeting

14 May 2012 - Preliminary TT report to UNSCEAR on meteorological analyses and ATM results

21 May 2012 – 59th session UNSCEAR progress and preliminary report

June 2012 - meteorological data and NWP analyses from TT members will be ready for sharing within TT

July 2012 – ZAMG (Wotawa) to provide available measurement data in DATEM format

October 2012 – TT to complete and provide ATM results using JMA meso-analyses within TT

November 2012 – NOAA (Draxler) to provide DATEM statistical results linked with model evaluation framework

December 2012 – TT meeting

March 2013 – TT to provide draft final report on meteorological analyses and ATM results

April 2013 – Final TT report provided to UNSCEAR on meteorological analyses and ATM results

May 2013 – 60th session UNSCEAR report

10. Closing

10.1 The first meeting of the Technical Task Team (TT) on Meteorological Analyses for Fukushima Daiichi NPP Accident closed at 17:15 on Friday, 2 December 2011.

ANNEX III**WMO Technical Task Team on Meteorological Analyses – Fukushima Daiichi NPP Accident****Terms of Reference**Membership and Chairperson

- Roland Draxler, Chairperson (RSMC Washington, USA)
- Matthew Hort (RSMC Exeter, UK)
- Gerhard Wotawa (RSMC Vienna, Austria)
- Kazuo Saito (Meteorological Research Institute, Japan Meteorological Agency, Japan)
- René Servranckx (Chairperson of CBS Coordination Group on Nuclear ERA, RSMC Montreal, Canada)

Terms of work

- Determine the relevant meteorological observational data sets and related information required to support the meteorological analyses and identify their archive location and availability;
- Determine which of the existing meteorological analyses are of sufficient spatial and temporal detail that can be used to estimate the atmospheric transport, dispersion, and surface deposition of radionuclides that were released from the nuclear accident and identify their archive location and availability;
- Identify gaps in the existing meteorological analyses that if addressed would make them more suitable for estimating atmospheric transport, dispersion, and deposition and in coordination with the WMO Secretariat, identify which members will provide updated analyses;
- Based upon the observational data and analyses, prepare a report on the temporal and spatial variations in atmospheric conditions during the nuclear accident;
- Evaluate the suitability and quality of the observational data and meteorological analyses for computing atmospheric transport, dispersion, and surface deposition by comparing the computational results with radiological measurements;
- Estimate the uncertainty in the atmospheric transport, dispersion and deposition (ATM) computations by comparing the results from several different ATMs and using different meteorological analyses;
- Liase and assist where possible with the UN Scientific Committee on the Effects of Atomic Radiation (UNSCEAR), in their study on the levels and effects of exposure due to the Fukushima Daiichi nuclear accident.
- Propose possible enhancements to the WMO EER system, including additional products and/or additional modes of operation with the relevant international organizations.

Duration and working arrangements

It is anticipated that the work of the Task Team would commence immediately, and span a period of 12 -18 months. The Team will work mainly by e-correspondence, and meet face-to-face, as needed. WMO Secretariat will facilitate the work of the team.

Table A4.1 - Meteorological observational data collected by JMA

Data name	Number of point	Duration	Data amount	levels	Elements
AWS (Fig. A4.1)	1300	10-minute: hourly, daily	Total amount of data 10-minute: 18GB (2003-2011) hourly & daily: 22GB (1976-2011) Shorter time periods are available	1	Precipitation amount (10-minute, hourly, daily), daily maximum precipitation (10-minute, hourly)
	800			1	temperature, wind speed/direction, sunshine duration (10-minute),
	300			1	Snow depth (hourly), snowfall depth (hourly, daily), maximum snow depth (daily)
Note of precipitation	150		16MB/month	1	Kinds of precipitation phenomenon, start/end time of the phenomenon, etc. (written in Japanese)
Radiosonde (Fig. A4.2)	16	twice a day	2MB/month	25	altitude, temperature, relative humidity, wind direction, wind speed and passing time at 25 standard level
			temperature/relative humidity: 8MB/month wind direction/speed: 5MB/month	variable	temperature/relative humidity, wind direction/speed at significant level
Wind profiler (Fig. A4.2)	31	every 10 minutes	50KB/day	variable	Wind direction, Wind speed, Vertical speed Signal to noise ratio

ANNEX VI

Meteorological conditions in East Japan for the March 11-26, 2011

1) Synoptic weather pattern:

After the passage of a weak pressure trough over East Japan from 9th to 11th a high pressure system moved eastward along the south coast of the main island of Japan from 11th to 13th. A weak low pressure system moved eastward off the south coast of the main island from 13th to 15th, and moved toward the northeast while developing rapidly after 15th. A low pressure system passed from 20th to 22nd over main island. (Fig. A6.1)

Fig. A6.1 - Surface weather chart at 0000 UTC (0900 JST) from 15 to 17 (upper) and from 21 to 23 (lower), March 2011.

2) Precipitation over east Japan:

Light rains were observed from 9th to 12th morning due to passage of a weak pressure trough over East Japan. Light rains were also observed from 15th to 17th morning due to a weak low pressure system which moved eastward off the south coast of the main. Moderate rains were given in the Kanto area from 20th to 23rd by a low pressure system which passed over the main island of Japan. (Fig. A6.2)

Fig. A6.2 – 24-hour accumulated precipitation amount and observed surface winds at 0000 UTC (0900 JST) for 15-17 (upper) and for 21-23 (lower), March 2011.

3) 950 hPa winds on March 15 by the mesoscale analysis of JMA:

The 950 hPa winds were westerly until the morning of 15th, but changed to NN-Easterly during the daytime of the 15th. After 1500 JST, the winds turned ES-Easterly, and then changed to Northerly after 0000 JST on the 16th (Fig. A6.3).

Fig. A6.3 – 950hPa winds (arrows) and mean sea level pressure (colour shade) by mesoscale analysis of JMA for 0000 UTC (0900 JST) – 1500 UTC (0000 JST), 15 March 2011.

- 4) Winds below 7 km observed at the wind profiler (Mito) nearest to the NPP during the period March 12-20:

The wind direction was southerly below 1 km while westerly above 1 km in the afternoon of March 12 when the hydrogen explosion occurred at the No. 1 reactor. Low level wind was southwesterly during the morning of the 14th when the hydrogen explosion occurred at the No. 3 reactor. Winds below 1 km were N-Easterly during the morning of the 15th when the reactor container burst occurred at the No. 2 reactor (Fig. A6.4).

Fig. A6.4 – Time series of winds below 7 km observed by a JMA wind profiler at the nearest point (Mito). a) From 1200 JST to 2400 JST, March 14. b): From 0000 JST to 2400 JST, March 14. C) From 0000 JST to 2400

JST, 15 March. Horizontal wind direction (barbs) and vertical speed of precipitation or air (colour shade).

5) Summary

The radionuclides were dispersed due to winds and other conditions, and this has been monitored (Fig. A6.5) and confirmed by Ministry of Education and Science and Technology (MEXT). The following two periods may have been the primary contributors to the observed deposition pattern:

- Southwestward transport by northeasterly low level winds from midnight of the 14th to early morning of the 15th and northwestward transport that resulted in the high density deposition pattern during the afternoon of the 15th
- Northward transport in the afternoon of the 20th and southward transport from midnight of the 21st to the early morning of the 22nd.

Modeling results by researchers in Japan generally support the above speculation (e.g., Yasunari *et al.*, 2011; Kajino *et al.*, 2011; Kondo *et al.*, 2011; Takigawa *et al.*, 2011; Kato *et al.*, 2011), but a high deposition area over the middle of the Fukushima prefecture has not yet been well simulated.

Fig. A6.5 – Regional deposition map of ^{137}Cs in surface soils observed by aircraft monitoring by MEXT (from home page of the Ministry of Education, Culture, Sports, Science and Technology (MEXT), Japan). (http://radioactivity.mext.go.jp/ja/1910/2011/11/1910_111112.pdf).

ANNEX VII

Computational Framework for the Fukushima Daiichi NPP Accident Simulations

The basic approach to the dispersion-deposition calculations to create an ATM calculation using a unit source rate (1/hr) for discrete emission time segments from the beginning to the end of the computational period. The concentration or deposition at any grid cell in the domain will be the sum of the contribution from each ATM emission segment after multiplying the resulting unit concentrations by the actual emission rate for each segment. Radioactive decay is also applied during this processing step.

- Computational period: 0000Z 11 March 2011 through 0000Z 21 April 2011
- Emission periods: 3-hour segments, 0000-0300; 0300-0600; ...
- Concentration & Deposition: 3-hour average & total, 0000-0300; 0300-0600; ...

The computational period consists of 41 days, each day has 8 emission periods, and therefore 328 independent simulations are required:

- Simulation #1: Emissions 0000Z-0300Z 11 March; Output 0000Z 11 March through 0000Z 21 April (328 output periods)
- Simulation #2: Emissions 0300Z-0600Z 11 March; Output 0300Z 11 March through 0000Z 21 April (327 output periods)
- Simulation # ...
- Simulation #328: Emissions 2100Z-0000Z 21 April; Output 2100Z 20 April through 0000Z 21 April (1 output period)

Three generic species should be tracked as surrogates for the radionuclides: a gas with no wet or dry scavenging, a gas with a relatively large dry deposition velocity and wet removal, and a particle with a small dry deposition velocity and wet removal.

Table A7.1 Summary the computational species

Type	Name	Wet Removal	Dry Deposition	Surrogate for
Gas	Ngas	No	No	Noble gases
Gas, depositing	Dgas	Yes	Yes	I-131
Particle, light	Lpar	Yes	Yes	Cs-137; I-131

The output concentration grid should be a regular spaced latitude-longitude grid where the latitude and longitude grid spacing may be different if desired. Although multiple output levels are possible, to limit the size of the output files, it is proposed that only the data from two levels and three computational species be submitted for evaluation: a level at height "0" m AGL defines the deposition, and a level at "100" represents the average concentration from the ground to 100 m AGL. Two concentration grids are suggested, one for regional simulations and one for global simulations:

Domain	Center Latitude	Center Longitude	Latitude Span	Longitude Span	Spacing Deg Lat	Spacing Deg Lon
Regional	38N	140E	20	30	0.05	0.05
Global	0	0	181	360	0.50	0.50

The file size issues can be significant. For example, a coarser resolution global calculation using a 6-hour emission frequency and a one-degree concentration grid with only one output data level resulted in a space requirement for all files of about 2 GB. For the global grid defined above, one could expect a much larger (4x horizontal, 2x vertical, 2x temporal) space requirement of about 32 GB. The regional grid is expected to require about 10 GB. Output files should be named according to the start of the release time: {Base_Name}_{MM}{DD}{HH}.

The proposed concentration file format follows the convention used by the NOAA ATM (HYSPLIT) and the resulting files would be compatible with all the current web based post-processing routines as well as numerous graphics and other output file manipulation programs available for Windows PC or Mac applications. Concentration files may be written in either packed or unpacked format. Concentration file packing does not write the same information in fewer bytes, but rather writes the same information using twice as many bytes. The packed files are generally smaller because only concentration values at the non-zero grid points are written to the output file by the model. However this requires the grid point location to be written with the concentration, hence the additional bytes. If most of the grid is expected to have non-zero concentrations, then the unpacked format will save space. The output files should be written as unformatted big-endian binary according to the following specification (a sample program will be provided):

Record #1

- CHAR*4 Meteorological *MODEL* Identification
- INT*4 Meteorological file start (*YEAR, MONTH, DAY, HOUR, FORECAST-HR*)
- INT*4 *NUMBER* of starting locations
- INT*4 Concentration packing flag (0=no 1=yes)

Record #2 Loop to record: Number of starting locations

- INT*4 Release starting time (*YEAR, MONTH, DAY, HOUR*)
- REAL*4 Starting location and height (*LATITUDE, LONGITUDE, METERS*)
- INT*4 Release starting time (*MINUTES*)

Record #3

- INT*4 Number of (*LATITUDE-POINTS, LONGITUDE-POINTS*)
- REAL*4 Grid spacing (*DELTA-LATITUDE, DELTA-LONGITUDE*)
- REAL*4 Grid lower left corner (*LATITUDE, LONGITUDE*)

Record #4

- INT*4 *NUMBER* of vertical levels in concentration grid
- INT*4 *HEIGHT* of each level (meters above ground)

Record #5

- INT*4 *NUMBER* of different pollutants in grid
- CHAR*4 Identification *STRING* for each pollutant

Record #6 Loop to record: Number of output times

- INT*4 Sample start (*YEAR MONTH DAY HOUR MINUTE FORECAST*)

Record #7 Loop to record: Number of output times

- INT*4 Sample stop (*YEAR MONTH DAY HOUR MINUTE FORECAST*)

Record #8 Loop to record: Number levels, Number of pollutant types

- CHAR*4 Pollutant type identification *STRING*
- INT*4 Output *LEVEL* (meters) of this record

No Packing (all elements)

- REAL*4 Concentration output *ARRAY*

Packing (only non-zero elements)

INT*4 Number of non-zero elements

- INT*2 First (I) index value
- INT*2 - Second (J) index value
- REAL*4 - Concentration at (I,J)
- ... repeat the above three values: times the number of non-zero elements

WORLD METEOROLOGICAL ORGANIZATION

COMMISSION FOR BASIC SYSTEMS

MEETING OF THE WMO TASK TEAM ON METEOROLOGICAL ANALYSES FOR FUKUSHIMA DAIICHI NUCLEAR POWER PLANT ACCIDENT

LONDON, UK, 1-3 MAY 2012

FINAL REPORT

Olivier Isnard, Peter Bedwell, Gerhard Wotawa, Matt Hort, Florian Gering, Roland Draxler, Peter Chen, Alain Malo, Kazuo Saito.

GENERAL SUMMARY OF THE WORK OF THE SESSION

1. Opening

1.1 The second meeting of the WMO Technical Task Team (TT) on Meteorological Analyses for Fukushima Daiichi NPP Accident was held at the offices of the Met Office UK, at Gray's Inn House, London, UK, and opened by the TT's chairperson, Mr Roland Draxler. Mr Draxler welcomed and expressed appreciation to all the participants. Mr Peter Chen, the representative of the WMO Secretariat recalled that the current task is to examine how the use of meteorological analyses and the introduction of additional meteorological observational data could improve the atmospheric dispersion calculations as validated against radiological monitoring data. The work of the TT will contribute to the requirements which the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) has stated in its request for assistance from WMO. In this regard, two experts of the UNSCEAR Study were invited to participate at this meeting: Mr Olivier Isnard of the French Institut de Radioprotection et de Sûreté Nucléaire (IRSN), and Mr Florian Gering of the German Bundesamt für Strahlenschutz (BfS). As well, UNSCEAR Study's UK experts of the Health Protection Agency, who are working in the UNSCEAR dose assessment group, were also invited to participate on one part of the agenda.

2. Adopting of agenda and working arrangements

2.1 Mr Draxler introduced the provisional agenda, which meeting adopted, and is found in Annex I.

2.2 The list of participants is found in Annex II. The meeting was informed that Mr René Servranckx (Canada), Chairperson of the CBS Coordination Group for Nuclear Emergency Response Activities, had notified the Secretariat that he was unable to attend this meeting. Instead, the work of RSMC Montréal contributing to the output of the TT was represented by Mr Alain Malo.

2.3 Daily working arrangements were agreed by the meeting.

3. Review of preliminary ATM runs for 11 – 31 March 2011

3.1 Mr Draxler provided a summary of the outcomes of the first meeting of the TT (Geneva, Dec. 2011), and also a summary of the progress made on the preliminary ATM runs for the period 11 – 31 March 2011, carried out by NOAA, JMA, Met Office UK, CMC. ZAMG (Austria) will soon provide its computations. JMA provided a regional ATM run using its high resolution mesoanalyses, while the other used their respective global analyses.

3.2 As per agreement from the first TT meeting, all members implemented the computational scheme for ATM simulations (Draxler, 2012). The meeting discussed various issues around the configuration of the ATM runs, including the source term and species, and the release height(s).

3.3 While waiting for the conclusion of the work of the UNSCEAR source term expert sub-group, these ATM runs were based on a source sequence following Chino (2011). Mr Isnard indicated that he was using a different source sequence, and agreed to provide the TT with a 3-hourly sequence of emissions and release height.

3.4 The group discussed as to whether the published source term data were valid at the time of release or at the time the fission reaction stopped. There was some uncertainty about this matter as Mr Wotawa indicated that for all their source term inversion calculations using measured data, the release amounts were decay corrected back to the time of the earthquake. Mr Isnard and Mr Gering will check with the UNSCEAR source term group and report back to the TT.

3.5 As for the release height, the different ATMs used different values for the releases, while Mr Isnard had computed with time varying release heights. While the TT agreed that it would be best to use a point release at a height of 100 metres above ground level, there was interest to understand the sensitivity of the results to varying release heights (to reflect explosive releases), and Mr Isnard agreed to also provide these data to the TT so that they could conduct sensitivity tests.

3.6 Mr Isnard noted that not all events are equally important and that getting the meteorological conditions correctly simulated on high emission days is critical in the assessment.

3.7 The meeting agreed that at this time the ATM results should be computed at 3-hourly intervals and at 5-km horizontal resolution. In addition to the graphical output and text based time series, the UNSCEAR representatives expressed the desire to have the ATM output also available in a binary format such as in NetCDF. Mr Draxler agreed to provide this option through the web interface and make the converter available to the TT members.

3.8 All ATM runs have accounted for wet deposition with NWP estimated rainfall rate, but have not as yet used the JMA high resolution precipitation analyses (derived from radar and raingauge data). These data will be available soon to TT members from a WMO, and from a JMA ftp site.

3.9 Mr Saito presented the Cs-137 deposition results from the JMA ATM using their mesoscale analyses, currently the only ATM to use these high-resolution data, which showed considerably more spatial structure than any of the other ATM calculations that used lower resolution global meteorological fields. He noted that the results are very sensitive to the source term and slight adjustments to the release rate could have a significant effect on the deposition pattern. The TT is awaiting the updated source term information that will be provided by UNSCEAR Group-B.

3.10 The meeting discussed the JMA results using their mesoscale analyses which suggested sensitivity of the ATM calculations to the vertical motion field. The JMA ATM results for Cs-137 deposition are shown below for calculations without (top panel) and with (bottom panel) vertical motion. Mr Saito noted that the observed pattern lies somewhere between the two calculations.

JMA Regional ATM (vad=0)

Cs-137 Deposition (Bq/m²) at ground-level
 Integrated from 1500 14 Mar to 1500 15 Mar 11 (UTC)
 Cpar Release started at 1800 11 Mar 11 (UTC)

RJTD METEOROLOGICAL DATA

JMA Regional ATM

Cs-137 Deposition (Bq/m²) at ground-level
 Integrated from 1500 14 Mar to 1500 15 Mar 11 (UTC)
 Cpar Release started at 1800 11 Mar 11 (UTC)

RJTD METEOROLOGICAL DATA

3.11 The following table summarizes the ATM runs that have been carried out.

Preliminary ATM Calculations (11-31 March 2011)

Center	Meteorology	ATM	Release	Output
CMC	GEM 0.30d 30 levels 6-hourly	MLDP0 dt=5min	1 unit/h 0-100 m AGL 300K p/3h	601x401 grid 0.05d x 100m 3-hr averaged
NOAA	GDAS 0.50d 56 levels 3-hourly	HYSPLIT dt=6min	1 unit/h 100 m AGL 300K p/3h	601x401 grid 0.05d x 100m 3-hr averaged
JMA	Meso Analysis 5-km 50 levels 3-hourly	Regional dt=10min	1 unit/h 0-100 m ASL 100K p/3h	721x577 grid 0.05d x 100m 3-hr averaged
UKMet	Unified 0.35x0.23 deg 70 levels 3-hourly	NAME dt=10min	1 unit/h 0-100 m AGL 300K p/3h	600x400 0.05d x 100m 3-hr averaged
ZAMG	ECMWF 0.2x0.2 deg 92 levels 3-hourly	FLEXPART dt=variable	1 unit/h 0-100 m AGL 300K p/3h	

3.12 The task team members agreed to provide a short technical document describing their ATM calculations which will be posted on the web site linked to each ATM. Mr Isnard and Mr Gering also agreed to provide to the TT members a short description of their atmospheric transport and dispersion model ATMs.

4. Evaluation of the sample JMA mesoscale meteorological analysis data files

4.1 Mr Saito presented the details of the JMA meso-analyses produced by a 4DVar system (ref. JMA, also see report of first TT meeting), and provided to members the entire dataset for the period 11 – 31 March 2011, at 3-hourly and 5-km horizontal resolution, in Lambert conformal map projection, which he had brought on memory sticks. The total dataset size is approximately 57 GB in GRIB2 format; a description of the dataset is included with the dataset. These data will also be made available to the larger UNSCEAR community from a WMO Internet accessible site, the exact URL is to be determined and provided by WMO Secretariat.

4.2 The meeting welcomed the offer of Mr Saito to provide a software tool to convert these files to latitude-longitude grid, while retaining the vertical hybrid terrain-following grid and also with an option to convert these data to pressure-level surfaces. Mr Saito indicated that this tool could be made available by the end of June 2012.

4.4 Mr Isnard and Mr Gering agreed that this JMA mesoanalyses dataset was probably very suitable for use by their own ATM and dose calculation systems, and will attempt to use it for their own ATM trials, compare their results with those produced by TT members and communicate these results with the TT.

4.5 The meeting noted that the intent of the TT was to provide guidance to UNSCEAR about the best meteorology to use for ATM calculations in their assessment. The issue was no longer a question of which meteorological analyses was most suitable to use, but how can the ATM models be optimized to work with the JMA data, whether computing vertical motion, stability, mixing, or deposition. Several TT members noted they will have to make changes to use these data which should provide valuable feedback to UNSCEAR groups planning to use the mesoscale analyses.

5. Status of verification data for ATM and meteorological evaluation

5.1 The meeting discussed the potential usefulness of CTBTO/IMS/RN data for verification of ATM results. Mr Wotawa explained to the meeting regarding CTBTO's data policy for these data, through informal consultations with the CTBTO/PTS. Aside from publishing actual data values, all other information generated from the use of such data may be made openly available to the public. While these data would be very useful for validating regional/global scale ATM results, there is only monitoring data from one such RN station (Takasaki) in Japan, located approximately 220 km west-southwest of Fukushima-Daiichi. The meeting agreed that they would not pursue this matter further with respect to verification of ATM calculations over Japan, but it might be useful for global calculations. Several TT members agreed to pursue this matter further, outside and independently of the current WMO TT ToR.

5.2 Mr Isnard will investigate the availability of other air concentration measurements at selected sites that could be used for verification.

5.3 Another approach is to use the deposition monitoring data that has been used to show the complex deposition pattern around the accident site. Mr Gering described sampling data from Japan, of 2000 data points, that are available from a high density of soil sampling sites within 100-200 km of the NPP, and he agreed to provide these data to the TT to evaluate the ATM outputs. Mr Draxler has already put in place a statistics package to compute the overall performance and ranking of the ATM outputs compared to measurement data which could then be added to the existing web interface and distribute to TT members.

6. Discussion on UNSCEAR requirements

6.1 Mr Peter Bedwell from the UK Health Protection Agency presented an overview of the work HPA conducted for the World Health Organization's assessment and the requirements that the UNSCEAR dose assessment group-C would need from the UNSCEAR dispersion modeling group-B. He noted that all the initial ATM calculations for WHO showed large under-predictions of particulate air concentrations outside of Japan with under-predictions increasing with distance. This was attributed to either excessive wet scavenging or uncertainty in the source term. Several TT members have reached similar conclusions using their own ATMs. This confirmed the TT focus on integrating higher resolution precipitation analysis with the ATM calculations

6.2 Mr Bedwell reviewed some of the ATM technical requirements for UNSCEAR's dose calculations. Although he expressed a desire for higher spatial resolution, the TT's configuration of 3-hourly and 5-km horizontal resolution was consistent with their requirements.

6.3 The meeting discussed the relationship of the TT ToR with the UNSCEAR requirements and clarified their respective roles. The WMO TT will be providing the higher resolution meteorological fields for UNSCEAR ATM calculations and technical guidance on how to use these analyses. WMO TT will not be doing any dose calculations for UNSCEAR. However, the UNSCEAR dispersion modeling group may access the TT ATM calculations to provide uncertainty estimates to their ATM calculations within the existing evaluation framework.

7. Review of the Terms of Reference of the WMO Task Team

The TT members reviewed and made one modification to its Terms of Reference, which is found in Annex III.

8. Revised Work plan and timetable

The TT reviewed and updated its work plan and time table as follows:

1 - 3 May 2012 – TT meeting, and meeting report

23 May 2012 - 59th session UNSCEAR progress and preliminary report (TT input provided from TT meeting of Dec. 2011)

31 May 2012 - TT members provide ATM model configuration summary

31 May 2012 - Mr Gering agreed to investigate the provision of surface measurement data; Mr Isnard agreed to investigate the provision of surface air concentration measurement data.

June 2012 - JMA high-resolution precipitation analyses and the JMA mesoscale analysis data converter be shared with TT members

June 2012 - TT discuss via email or teleconference the verification potential of measurement data

Early July 2012 - (before UNSCEAR all-experts meeting) – teleconference on progress of TT activities

July 2012 - NOAA (Draxler) to provide DATEM statistical results linked with model evaluation framework

September 2012 - TT to complete and provide ATM results using JMA meso-analyses. JMA to provide a comparison of the JMA mesoanalyses of precipitation with the JMA high-resolution precipitation analyses

December 2012 - third TT meeting, drafting final TT report

May 2013 – 60th session UNSCEAR report

9. Closing

The meeting was closed at 15:00, Thursday 3 May 2012.

ANNEX III - Terms of Reference

WMO Technical Task Team on Meteorological Analyses – Fukushima Daiichi NPP Accident

Membership and Chairperson

- Roland Draxler, Chairperson (RSMC Washington, USA)
- Matthew Hort (RSMC Exeter, UK)
- Gerhard Wotawa (RSMC Vienna, Austria)
- Kazuo Saito (Meteorological Research Institute, Japan Meteorological Agency, Japan)
- René Servranckx (Chairperson of CBS Coordination Group on Nuclear ERA, RSMC Montreal, Canada)

Terms of work

- (a) Determine the relevant meteorological observational data sets and related information required to support the meteorological analyses and identify their archive location and availability;
- (b) Determine which of the existing meteorological analyses are of sufficient spatial and temporal detail that can be used to estimate the atmospheric transport, dispersion, and surface deposition of radionuclides that were released from the nuclear accident and identify their archive location and availability;
- (c) Identify gaps in the existing meteorological analyses that if addressed would make them more suitable for estimating atmospheric transport, dispersion, and deposition and in coordination with the WMO Secretariat, identify which members will provide updated analyses;
- (d) Based upon the observational data and analyses, prepare a report on the temporal and spatial variations in atmospheric conditions during the nuclear accident;
- (e) Evaluate the suitability and quality of the observational data and meteorological analyses for computing atmospheric transport, dispersion, and surface deposition by comparing the computational results with radiological measurements;
- (f) Provide a number of atmospheric transport, dispersion and deposition (ATM) outputs from several different ATMs using different meteorological analyses;
- (g) Liaise and assist where possible with the UN Scientific Committee on the Effects of Atomic Radiation (UNSCEAR), in their study on the levels and effects of exposure due to the Fukushima Daiichi nuclear accident.
- (h) Propose possible enhancements to the WMO EER system, including additional products and/or additional modes of operation with the relevant international organizations.

Duration and working arrangements

It is anticipated that the work of the Task Team spans a period of 12 -18 months from December 2011. The Team will work mainly by e-correspondence, and meet face-to-face, as needed. WMO Secretariat will facilitate the work of the team.

(ToR updated, 3 May 2012)

WORLD METEOROLOGICAL ORGANIZATION

**THIRD MEETING OF WMO TASK TEAM ON
METEOROLOGICAL
ANALYSES FOR FUKUSHIMA-DAIICHI NUCLEAR
POWER PLANT ACCIDENT**

VIENNA, AUSTRIA, 3 – 5 DECEMBER 2012

FINAL REPORT

***Dèlia Arnold, Gerhard Wotawa, Matthew Hort, Roland Draxler, Peter Chen,
Stefano Galmarini, Kazuo Saito, René Servranckx***

EXECUTIVE SUMMARY

The WMO Task Team on Meteorological Analyses for Fukushima Daiichi NPP Accident was formed in late 2011 to develop a series of meteorological analyses in numerical form, using as much observational data and related information as available, that will be suitable for estimating the atmospheric transport, dispersion and deposition of radioactivity released from the Fukushima-Daiichi Nuclear Power Plant in 2011. This is the report of the Task Team's third and final meeting, whose members developed a final record of its work and outputs.

Since the time of the Task Team's second meeting, Mr Draxler engaged the collaboration of the European Commission Joint Research Centre ENSEMBLE project to assist in the evaluation of a set of 18 different "runs" of meteorological and atmospheric dispersion and deposition calculations.

Mr Roland Draxler, the Chairperson of this Task Team, will use the final report of the team to develop suitable condensed text as input to the study on the levels and effects of the radioactivity released from the nuclear accident, being conducted by the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR).

The report also suggests possible improvements to the present nuclear emergency response arrangements.

1 Opening

1.1 The third meeting of the WMO Technical Task Team (TT) on Meteorological Analyses for Fukushima Daiichi NPP Accident was held at the offices of the Zentralanstalt für Meteorologie und Geodynamik (ZAMG), Vienna, Austria, and opened by the TT's chairperson, Mr Roland Draxler. Mr Michael Straudinger, Director of ZAMG and PR of Austria with WMO, welcomed the participants. He noted the importance of the work of this Task Team and expected that there would be some important suggestions for improving WMO's nuclear emergency response procedures, supporting National Meteorological Services.

Mr Draxler welcomed the participants and expressed appreciation to all the participants for their efforts in this work and for participating at this crucial and final meeting. Mr Peter Chen, on behalf of the WMO Secretariat, added appreciation for the hard work of members over the last year, the outcome of which will meet the requirements expressed by the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR). Mr Stefano Galmarini of the EC/JRC was invited to participate at this meeting in relation to the EC/ENSEMBLE assessment tools that were used to evaluate the atmospheric transport and dispersion runs carried out by the TT members. The participants expressed their appreciation to ZAMG and Mr Gerhard Wotawa for hosting the meeting and for having provided the local arrangements for the meeting.

Mr Draxler recalled the history of this Task Team's work, including the development of its Terms of Reference at the first meeting (see first meeting report) and agreement by Executive Council at its 64th session (2012), and leading up to this third and final meeting. Mr Draxler also informed the meeting of his participation at, and interactions with the UNSCEAR Expert Groups. In particular, he indicated that UNSCEAR had decided in July 2012 that the dose estimation group would use an ensemble output from the WMO TT as input to their dose calculations. This decision was a change from an earlier understanding that the WMO was only to provide the best meteorological analyses during the period 11 – 31 March 2011, to be applied in the atmospheric transport and dispersion modeling of radionuclides released during the nuclear power plant accident. The meeting noted that UNSCEAR finally established the source term time series in mid-October 2012. It was also noted that UNSCEAR requires a descriptive document on the atmospheric transport and dispersion/deposition results, and meteorological aspects by 14 December 2012.

1.2 Adoption of agenda and working arrangements

Mr Draxler introduced the provisional agenda, which the meeting adopted, and is found in Annex I. Daily working arrangements were decided.

1.3 The list of participants is found in Annex II.

2 Final Report of the Task Team

2.1 The TT members each provided a verbal summary of their respective contributions to this work, and discussed numerous technical issues related to its tasks. Mr Galmarini of EC/JRC provided a briefing on the ENSEMBLE assessment of the 18 ATM modelling results, including the various metrics used in the evaluation. He agreed

to provide suitable text to describe this assessment to be included in the final report of the TT.

2.2 The meeting developed a report of the work of the TT, and agreed to undertake final revisions by the end of January 2013. The version of TT report reached by 21 December 2012 is found in Annex III.

3 AMS Conference session on Fukushima accident

3.1 Mr Draxler recalled that American Meteorological Society (AMS) Committee on Meteorological Aspects of Air Pollution, and the Meteorological Society of Japan (MSJ) will jointly convene a one-day specialty symposium at the AMS 2013 Annual Meeting to review the present status and identify the role of meteorology for the analysis of the transport and dispersion of contaminants from the Fukushima nuclear power plant. A special journal publication is planned.

3.2 Mr Draxler has submitted an abstract of his presentation on the work of this TT. Mr Saito has submitted an abstract of his presentation of the JMA regional ATM for the accident.

3.3 Mr Draxler considered the opinion of TT members regarding the submission of an extended abstract to the planned AMS journal publication. Recalling the deadline for this submission is 10 February 2013, the members were of the general opinion that little time is available to deal with unresolved scientific questions prior to this deadline. Mr Saito indicated that he intends to submit an extended abstract for the journal publication.

3.4 The TT then considered alternative publication opportunities, including the possibility to initiate collaboration with a suitable scientific journal (e.g. Atmospheric Environment) to produce a special issue on meteorological aspects of the Fukushima-Daiichi accident. Such a special issue could include topic areas such as: source term estimation, dispersion and deposition estimation, use of high resolution precipitation analyses, ensemble techniques, etc. Mr Draxler will contact a suitable journal office to explore this possibility, including time-lines, and whether another similar development is already underway. Mr Chen will explore with WMO Secretariat whether such a special publication could be coordinated and developed through WMO. Upon favourable responses, WMO could invite its Members to participate, including all the RSMCs for ERA.

3.5 Mr Wotawa indicated that he plans to make a presentation on the TT's work to the annual meeting of the European Geophysical Union (Vienna, week of 8 April 2013).

4 Cooperation with the Science Council of Japan (SCJ) model evaluation

4.1 Mr Draxler and Mr Hort were contacted by Mr Teruyuki Nakajima, Chairperson of the Working Group for model inter-comparison of the Science Council of Japan (SCJ), who would like to review the modelling capability of the dispersion and deposition of radioactive materials to the land and the ocean as a result of the Fukushima Daiichi Nuclear Power Plant accident. The purpose of this initiative is to compare existing model results in order to access the uncertainty in the results. Mr Draxler provided to

Mr Nakajima the NOAA Web page URL where the TT model results are posted. The SCJ has subsequently contacted WMO informally regarding its interest, or the interest of individual TT members to participate.

4.2 The TT decided not to participate as a group, while Mr Saito indicated that JMA will participate in this model inter-comparison.

5 WMO EER System

5.1 RSMC-ENSEMBLE experiment

5.1.1 Mr Wotawa presented the results of the RSMC ENSEMBLE experiment that was conducted earlier this year, which was based on a fictitious scenario of a NPP accident in USA, on 18 April 2012, 0430 UTC. The results showed a wide range of model results from 9 RSMCs. RSMC Washington is expected to provide its results shortly.

5.1.2 Mr Wotawa agreed to provide the presentation and a summary of the evaluation to Mr Servranckx (Chairperson of the CBS Expert Team on ERA). Mr Servranckx will then communicate this information to the representatives of the RSMCs.

5.1.3 The TT considered the possibility of creating an ENSEMBLE session for the Fukushima-Daiichi ATM results, to open the participation to other RSMCs and possibly other ATM centres. Such a project could support the scientific work of contributors to the possible special journal issue on the meteorological aspects of the Fukushima-Daiichi accident (see agenda item 3).

5.2 Enhancement to the WMO EER system based on TT's experience

5.2.1 The TT discussed the present arrangements, in particular the RSMC-ERA system that serves both WMO Members, the IAEA, and other relevant International Organizations. The Secretariat recalled that under IAEA's Action Plan for Nuclear Safety, established since the Fukushima accident, provides the IAEA/IEC with a broader mandate to assess accident situations, and to predict possible impacts. This would be a more favourable environment to undertake a joint review of IAEA requirements for meteorological products and services for nuclear ERA.

5.2.2 The following suggestions could be pursued by the CBS Expert Team on ERA (chaired by Mr Servranckx), and Secretariat:

- Explore if the formation of an interdisciplinary science forum would be useful to advance the science to support operational ATM programmes (nuclear, non-nuclear):
- Convene with IAEA, a users requirements conference (previous one was in 1993). This is already in the list of actions of the Expert Team on ERA;
- Discuss informally with IAEA about the concept for a new computational framework (operational atmospheric dilution factors, and ensembles) for ATM in ERA, which would provide additional capabilities to IAEA/IEC to apply source information, and to interpret radiological measurements;
- WMO may wish to contact IAEA at the senior management level regarding improved meteorological products and services.

6 Future status of the NOAA hosted web page with TT ATDM results

6.1 Mr Draxler offered to continue hosting the web page, and the TT members gratefully accepted. This web page would be “re-branded” from the current “TT Meteorological Analysis” site, to become a generic site with tools for incorporating ATM results for the Fukushima accident, with the possibility for participating ATM centres to update with improved simulations. In addition Mr Draxler agreed to send the Web php file(s) to participating centres, in sequence, to update each centre’s information and attributions (e.g. logo).

7 Closing

7,1 The meeting closed at 17:15, Wednesday, 5 December 2012

ANNEX I - AGENDA

WMO Task Team on Meteorological Analysis of Fukushima-Daiichi NPP Accident 3 – 5 December 2012, Vienna, Austria

- 1 Opening and adoption of the agenda
- 2 Final Report of the Task Team
- 3 AMS Conference session on Fukushima accident
- 4 Cooperation with the Science Council of Japan (SCJ) model evaluation
- 5 WMO EER System
 - 5.1 Review and discuss the RSMC-ENSEMBLE experiment
 - 5.2 Recommend enhancements to the WMO EER system
- 6 Future status of the NOAA hosted web page with TT ATDM results
- 7 Closing

ANNEX II – List of Participants
